S32K1xx Data Sheet

Notes

- The following two attachments are available with the Datasheet:
 - S32K1xx_Orderable_Part_Number_List.xlsx
 - S32K1xx_Power_Modes_Configuration.xlsx

Key Features

- Operating characteristics
 - Voltage range: 2.7 V to 5.5 V
 - Ambient temperature range: -40 °C to 105 °C for HSRUN mode, -40 °C to 125 °C for RUN mode
- Arm™ Cortex-M4F/M0+ core, 32-bit CPU
 - Supports up to 112 MHz frequency (HSRUN mode) with 1.25 Dhrystone MIPS per MHz
 - Arm Core based on the Armv7 Architecture and Thumb®-2 ISA
 - Integrated Digital Signal Processor (DSP)
 - Configurable Nested Vectored Interrupt Controller (NVIC)
 - Single Precision Floating Point Unit (FPU)
- Clock interfaces
 - 4 - 40 MHz fast external oscillator (SOSC) with up to 50 MHz DC external square input clock in external clock mode
 - 48 MHz Fast Internal RC oscillator (FIRC)
 - 8 MHz Slow Internal RC oscillator (SIRC)
 - 128 kHz Low Power Oscillator (LPO)
 - Up to 112 MHz (HSRUN) System Phased Lock Loop (SPLL)
 - Up to 20 MHz TCLK and 25 MHz SWD_CLK
 - 32 kHz Real Time Counter external clock (RTC_CLKIN)
- Power management
 - Low-power Arm Cortex-M4F/M0+ core with excellent energy efficiency
 - Power Management Controller (PMC) with multiple power modes: HSRUN, RUN, STOP, VLPR, and VLPS. Note: CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device will need to switch to RUN mode (80 Mhz) to execute CSEc (Security) or EEPROM writes/erase.
 - Clock gating and low power operation supported on specific peripherals.
- Memory and memory interfaces
 - Up to 2 MB program flash memory with ECC
 - 64 KB FlexNVM for data flash memory with ECC and EEPROM emulation. Note: CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device will need to switch to RUN mode (80 MHz) to execute CSEc (Security) or EEPROM writes/erase.
 - Up to 256 KB SRAM with ECC
 - Up to 4 KB of FlexRAM for use as SRAM or EEPROM emulation
 - Up to 4 KB Code cache to minimize performance impact of memory access latencies
 - QuadSPI with HyperBus™ support
- Mixed-signal analog
 - Up to two 12-bit Analog-to-Digital Converter (ADC) with up to 32 channel analog inputs per module
 - One Analog Comparator (CMP) with internal 8-bit Digital to Analog Converter (DAC)
- Debug functionality
 - Serial Wire JTAG Debug Port (SWJ-DP) combines
 - Debug Watchpoint and Trace (DWT)
 - Instrumentation Trace Macrocell (ITM)
 - Test Port Interface Unit (TPIU)
 - Flash Patch and Breakpoint (FPB) Unit
- Human-machine interface (HMI)
 - Up to 156 GPIO pins with interrupt functionality
 - Non-Maskable Interrupt (NMI)

- Communications interfaces
 - Up to three Low Power Universal Asynchronous Receiver/Transmitter (LPUART/LIN) modules with DMA support and low power availability
 - Up to three Low Power Serial Peripheral Interface (LPSPI) modules with DMA support and low power availability
 - Up to two Low Power Inter-Integrated Circuit (LPI2C) modules with DMA support and low power availability
 - Up to three FlexCAN modules (with optional CAN-FD support)
 - FlexIO module for emulation of communication protocols and peripherals (UART, I2C, SPI, I2S, LIN, PWM, etc).
 - Up to one 10/100Mbps Ethernet with IEEE1588 support and two Synchronous Audio Interface (SAI) modules.
- Safety and Security
 - Cryptographic Services Engine (CSEc) implements a comprehensive set of cryptographic functions as described in the SHE (Secure Hardware Extension) Functional Specification. Note: CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device will need to switch to RUN mode (80 MHz) to execute CSEc (Security) or EEPROM writes/erase.
 - 128-bit Unique Identification (ID) number
 - Error-Correcting Code (ECC) on flash and SRAM memories
 - System Memory Protection Unit (System MPU)
 - Cyclic Redundancy Check (CRC) module
 - Internal watchdog (WDOG)
 - External Watchdog monitor (EWM) module
- Timing and control
 - Up to eight independent 16-bit FlexTimers (FTM) modules, offering up to 64 standard channels (IC/OC/PWM)
 - One 16-bit Low Power Timer (LPTMR) with flexible wake up control
 - Two Programmable Delay Blocks (PDB) with flexible trigger system
 - One 32-bit Low Power Interrupt Timer (LPIT) with 4 channels
 - 32-bit Real Time Counter (RTC)
- Package
 - 32-pin QFN, 48-pin LQFP, 64-pin LQFP, 100-pin LQFP, 100-pin MAPBGA, 144-pin LQFP, 176-pin LQFP package options
- 16 channel DMA with up to 63 request sources using DMAMUX

1 Block diagram

Following figures show superset high level architecture block diagrams of S32K14x series and S32K11x series respectively. Other devices within the family have a subset of the features. See [Feature comparison](#) for chip specific values.

1: On this device, NXP's system MPU implements the safety mechanisms to prevent masters from accessing restricted memory regions. This system MPU provides memory protection at the level of the Crossbar Switch. Each Crossbar master (Core, DMA, Ethernet) can be assigned different access rights to each protected memory region. The Arm M4 core version in this family does not integrate the Arm Core MPU, which would concurrently monitor only core-initiated memory accesses. In this document, the term MPU refers to NXP's system MPU.

2: For the device-specific sizes, see the "On-chip SRAM sizes" table in the "Memories and Memory Interfaces" chapter of the S32K1xx Series Reference Manual.

3: CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device needs to switch to RUN mode (80 MHz) to execute CSEc (Security) or EEPROM writes/erase.

○ Not implemented

● Available on the device

1 No write or erase access to Flash module, including Security (CSEc) and EEPROM commands, are allowed when device is running at HSRUN mode (112MHz) or VLPR mode.

2 Available when EEPROM, CSEc and Data Flash are not used. Else only up to 1,984 KB is available for Program Flash.

3 4 KB (up to 512 KB D-Flash as a part of 2 MB Flash). Up to 64 KB of flash is used as EEPROM backup and the remaining 448 KB of the last 512 KB block can be used as Data flash or Program flash. See chapter FTFC for details.

4 Only for Boundary Scan Register

5 See Dimensions section for package drawings

6 Under development, QuadSPI not supported for S32K148 in 100-pin LQFP

3 Ordering information

3.1 Selecting orderable part number

Not all part number combinations are available. See the attachment *S32K1xx_Orderable_Part_Number_List.xlsx* attached with the Datasheet for a list of standard orderable part numbers.

3.2 Ordering information

1. CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device will need to switch to RUN mode (80 MHz) to execute CSEc (Security) or EEPROM writes/erase.

2. Part numbers no longer offered as standard include:

Ordering Option X

M: 64MHz

Ordering Option Y

N: limited RAM. 16KB for K142, 48KB for K144, 96KB for K146, 192KB for K148

R: Basic feature set

S: Security

B: CAN FD, FlexIO, limited RAM (S32K14x only)

C: CAN FD, FlexIO, Security, limited RAM (S32K14x only)

Temperature

C: -40C to 85C

NOTE

Not all part number combinations are available. See S32K1xx_Orderable_Part_Number_List.xlsx attached with the Datasheet for list of standard orderable parts.

4 General

4.1 Absolute maximum ratings

NOTE

- Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed. See footnotes in the following table for specific conditions.
- Stress beyond the listed maximum values may affect device reliability or cause permanent damage to the device.
- All the limits defined in the datasheet specification must be honored together and any violation to any one or more will not guarantee desired operation.
- Unless otherwise specified, all maximum and minimum values in the datasheet are across process, voltage, and temperature.

Table 1. Absolute maximum ratings

Symbol	Parameter	Conditions ¹	Min	Max	Unit
V_{DD} ²	2.7 V - 5.5V input supply voltage	—	-0.3	5.8 ³	V
V_{REFH}	3.3 V / 5.0 V ADC high reference voltage	—	-0.3	5.8 ³	V
$I_{INJPAD_DC_ABS}$ ⁴	Continuous DC input current (positive / negative) that can be injected into an I/O pin	—	-3	+3	mA
V_{IN_DC}	Continuous DC Voltage on any I/O pin with respect to V_{SS}	—	-0.8	5.8 ⁵	V
$I_{INJSUM_DC_ABS}$	Sum of absolute value of injected currents on all the pins (Continuous DC limit)	—	—	30	mA
T_{ramp} ⁶	ECU supply ramp rate	—	0.5 V/min	500 V/ms	—
T_{ramp_MCU} ⁷	MCU supply ramp rate	—	0.5 V/min	100 V/ms	—
T_A ⁸	Ambient temperature	—	-40	125	°C
T_{STG}	Storage temperature	—	-55	165	°C
$V_{IN_TRANSIENT}$	Transient overshoot voltage allowed on I/O pin beyond V_{IN_DC} limit	—	—	6.8 ⁹	V

1. All voltages are referred to V_{SS} unless otherwise specified.
2. As V_{DD} varies between the minimum value and the absolute maximum value the analog characteristics of the I/O and the ADC will both change. See section [I/O parameters](#) and [ADC electrical specifications](#) respectively for details.
3. 60 seconds lifetime – No restrictions i.e. the part is not held in reset and can switch.
10 hours lifetime – The part is held in reset by an external circuit i.e. the part cannot switch.

General

The supply should be kept in operating conditions and once out of operating conditions, the device should be either reset or powered off.

Operation with supply between 5.5 V and 5.8 V not in reset condition is allowed for 60 seconds cumulative over lifetime, the part will operate with reduced functionality.

Operation with supply between 5.5 V and 5.8 V but held in reset condition by external circuit is allowed for 10 hours cumulative over lifetime.

If the given time limits or supply levels are exceeded, the device may get damaged.

4. When input pad voltage levels are close to V_{DD} or V_{SS} , practically no current injection is possible.
5. While respecting the maximum current injection limit
6. This is the Electronic Control Unit (ECU) supply ramp rate and not directly the MCU ramp rate. Limit applies to both maximum absolute maximum ramp rate and typical operating conditions.
7. This is the MCU supply ramp rate and the ramp rate assumes that the S32K1xx HW design guidelines in AN5426 are followed. Limit applies to both maximum absolute maximum ramp rate and typical operating conditions.
8. T_J (Junction temperature)=135 °C. Assumes T_A =125 °C for RUN mode

T_J (Junction temperature)=125 °C. Assumes T_A =105 °C for HSRUN mode

- Assumes maximum θ_{JA} for 2s2p board. See [Thermal characteristics](#)

9. 60 seconds lifetime; device in reset (no outputs enabled/toggling)

4.2 Voltage and current operating requirements

NOTE

Device functionality is guaranteed up to the LVR assert level, however electrical performance of 12-bit ADC, CMP with 8-bit DAC, IO electrical characteristics, and communication modules electrical characteristics would be degraded when voltage drops below 2.7 V

Table 2. Voltage and current operating requirements 1

Symbol	Description	Min.	Max.	Unit	Notes
V_{DD} ²	Supply voltage	2.7 ³	5.5	V	4
V_{DD_OFF}	Voltage allowed to be developed on V_{DD} pin when it is not powered from any external power supply source.	0	0.1	V	
V_{DDA}	Analog supply voltage	2.7	5.5	V	4
$V_{DD} - V_{DDA}$	V_{DD} -to- V_{DDA} differential voltage	-0.1	0.1	V	4
V_{REFH}	ADC reference voltage high	2.7	$V_{DDA} + 0.1$	V	5
V_{REFL}	ADC reference voltage low	-0.1	0.1	V	
V_{ODPU}	Open drain pullup voltage level	V_{DD}	V_{DD}	V	6
$I_{INJPAD_DC_OP}$ ⁷	Continuous DC input current (positive / negative) that can be injected into an I/O pin	-3	+3	mA	
$I_{INJSUM_DC_OP}$	Continuous total DC input current that can be injected across all I/O pins such that there's no degradation in accuracy of analog modules: ADC and ACMP (See section Analog Modules)	—	30	mA	

1. Typical conditions assumes $V_{DD} = V_{DDA} = V_{REFH} = 5\text{ V}$, temperature = $25\text{ }^{\circ}\text{C}$ and typical silicon process unless otherwise stated.
2. As V_{DD} varies between the minimum value and the absolute maximum value the analog characteristics of the I/O and the ADC will both change. See section [I/O parameters](#) and [ADC electrical specifications](#) respectively for details.
3. S32K148 will operate from 2.7 V when executing from internal FIRC. When the PLL is engaged S32K148 is guaranteed to operate from 2.97 V. All other S32K family devices operate from 2.7 V in all modes.
4. V_{DD} and V_{DDA} must be shorted to a common source on PCB. The differential voltage between V_{DD} and V_{DDA} is for RF-AC only. Appropriate decoupling capacitors to be used to filter noise on the supplies. See application note [AN5032](#) for reference supply design for SAR ADC.
5. V_{REFH} should always be equal to or less than $V_{DDA} + 0.1\text{ V}$ and $V_{DD} + 0.1\text{ V}$
6. Open drain outputs must be pulled to V_{DD} .
7. When input pad voltage levels are close to V_{DD} or V_{SS} , practically no current injection is possible.

1. Values mentioned are measured at $\leq 112\text{ MHz}$ in HSRUN mode.
2. Values mentioned are measured at $\leq 80\text{ MHz}$ in RUN mode.

4.4 Power and ground pins

NOTE: V_{DD} and V_{DDA} must be shorted to a common source on PCB

Figure 5. Pinout decoupling

Table 4. Supplies decoupling capacitors 1, 2

Symbol	Description	Min. ³	Typ.	Max.	Unit
C_{REF} ^{4, 5}	ADC reference high decoupling capacitance	70	100	—	nF
C_{DEC} ^{5, 6, 7}	Recommended decoupling capacitance	70	100	—	nF

1. V_{DD} and V_{DDA} must be shorted to a common source on PCB. The differential voltage between V_{DD} and V_{DDA} is for RF-AC only. Appropriate decoupling capacitors to be used to filter noise on the supplies. See application note AN5032 for reference supply design for SAR ADC. All V_{SS} pins should be connected to common ground at the PCB level.
2. All decoupling capacitors must be low ESR ceramic capacitors (for example X7R type).
3. Minimum recommendation is after considering component aging and tolerance.
4. For improved performance, it is recommended to use 10 μ F, 0.1 μ F and 1 nF capacitors in parallel.
5. All decoupling capacitors should be placed as close as possible to the corresponding supply and ground pins.
6. Contact your local Field Applications Engineer for details on best analog routing practices.
7. The filtering used for decoupling the device supplies must comply with the following best practices rules:
 - The protection/decoupling capacitors must be on the path of the trace connected to that component.
 - No trace exceeding 1 mm from the protection to the trace or to the ground.
 - The protection/decoupling capacitors must be as close as possible to the input pin of the device (maximum 2 mm).
 - The ground of the protection is connected as short as possible to the ground plane under the integrated circuit.

*Note: VSSA and VSS are shorted at package level

4.5 LVR, LVD and POR operating requirements

Table 5. V_{DD} supply LVR, LVD and POR operating requirements

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
V_{POR}	Rising and falling V_{DD} POR detect voltage	1.1	1.6	2.0	V	
V_{LVR}	LVR falling threshold (RUN, HSRUN, and STOP modes)	2.50	2.58	2.7	V	
V_{LVR_HYST}	LVR hysteresis	—	45	—	mV	1
V_{LVR_LP}	LVR falling threshold (VLPS/VLPR modes)	1.97	2.22	2.44	V	
V_{LVD}	Falling low-voltage detect threshold	2.8	2.875	3	V	
V_{LVD_HYST}	LVD hysteresis	—	50	—	mV	1

Table continues on the next page...

Table 5. V_{DD} supply LVR, LVD and POR operating requirements (continued)

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
V_{LVW}	Falling low-voltage warning threshold	4.19	4.305	4.5	V	
V_{LVW_HYST}	LVW hysteresis	—	75	—	mV	1
V_{BG}	Bandgap voltage reference	0.97	1.00	1.03	V	

1. Rising threshold is the sum of falling threshold and hysteresis voltage.

HSRUN should only be used when frequencies in excess of 80 MHz are required. When using 80 MHz and below, RUN mode is the recommended operating mode.

4.7 Power consumption

The following table shows the power consumption targets for the device in various mode of operations. Attached *S32K1xx_Power_Modes_Configuration.xlsx* details the modes used in gathering the power consumption data stated in the following table [Table 7](#). For full functionality refer to table: Module operation in available power modes of the *Reference Manual*.

1. Typical current numbers are indicative for typical silicon process and may vary based on the silicon distribution and user configuration. Typical conditions assumes $V_{DD} = V_{DDA} = V_{REFH} = 5\text{ V}$, temperature = 25 °C and typical silicon process unless otherwise stated. All output pins are floating and On-chip pulldown is enabled for all unused input pins.
2. Current numbers are for reduced configuration and may vary based on user configuration and silicon process variation.
3. HSRUN mode must not be used at 125°C. Max ambient temperature for HSRUN mode is 105°C.
4. Values mentioned for S32K14x devices are measured at RUN@80 MHz with peripherals disabled and values mentioned for S32K11x devices are measured at RUN@48 MHz with peripherals disabled.
5. With PMC_REGSC[CLKBIASDIS] set to 1. See Reference Manual for details.
6. Data collected using RAM
7. Numbers on limited samples size and data collected with Flash
8. The S32K148 data points assume that ENET/QuadSPI/SAI etc. are inactive.

1. All power numbers listed in this table are typical power numbers
2. Current numbers are quoted for a certain application code and may vary on user configuration and silicon process variation.
3. The power numbers are not strictly for the VLPS mode operation alone, but also includes power due to periodic wakeup. The power therefore includes wakeup plus VLPS mode activity. This leads to greater dependence of power numbers on application code.
4. The single LPSPi used is LPSPi1 in S32K14X devices but LPSPi0 in S32K11x devices.

The following table shows the power consumption targets for S32K148 in various mode of operations measure at 3.3 V.

4.9 EMC radiated emissions operating behaviors

EMC measurements to IC-level IEC standards are available from NXP on request.

5 I/O parameters

5.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

Figure 7. Input signal measurement reference

5.2 General AC specifications

These general purpose specifications apply to all signals configured for GPIO, UART, and timers.

Table 10. General switching specifications

Symbol	Description	Min.	Max.	Unit	Notes
	GPIO pin interrupt pulse width (digital glitch filter disabled) — Synchronous path	1.5	—	Bus clock cycles	1, 2
	GPIO pin interrupt pulse width (digital glitch filter disabled, passive filter disabled) — Asynchronous path	50	—	ns	3
WFRST	$\overline{\text{RESET}}$ input filtered pulse	—	10	ns	4
WNFRST	$\overline{\text{RESET}}$ input not filtered pulse	Maximum of (100 ns, bus clock period)	—	ns	5

1. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In Stop and VLPS modes, the synchronizer is bypassed so shorter pulses can be recognized in that case.
2. The greater of synchronous and asynchronous timing must be met.
3. These pins do not have a passive filter on the inputs. This is the shortest pulse width that is guaranteed to be recognized.
4. Maximum length of $\overline{\text{RESET}}$ pulse which will be the filtered by internal filter only if PCR_PTA5[PFE] is at its reset value of 1'b1.
5. Minimum length of $\overline{\text{RESET}}$ pulse, guaranteed not to be filtered by the internal filter only if PCR_PTA5[PFE] is at its reset value of 1'b1. This number depends on the bus clock period also. In this case, minimum pulse width which will cause reset is 250 ns. For faster clock frequencies which have clock period less than 100 ns, the minimum pulse width not filtered will

be 100 ns. After this filtering mechanism, the software has an option to put additional filtering in addition to this, by means of PCM_RPC register and/or PORT_DFER register for PTA5.

1. S32K148 will operate from 2.7 V when executing from internal FIRC. When the PLL is engaged S32K148 is guaranteed to operate from 2.97 V. All other S32K family devices operate from 2.7 V in all modes.
2. For reset pads, same V_{ih} levels are applicable
3. For reset pads, same V_{il} levels are applicable

4. The value given is measured at high drive strength mode. For value at low drive strength mode see the Ioh_Standard value given above.
5. For reference only. Run simulations with the IBIS model and custom board for accurate results.
6. Several I/O have both high drive and normal drive capability selected by the associated Portx_PCRn[DSE] control bit. All other GPIOs are normal drive only. For details see IO Signal Description Input Multiplexing sheet(s) attached with the *Reference Manual*.
7. When using ENET and SAI on S32K148, the overall device limits associated with high drive pin configurations must be respected i.e. On 144-pin LQFP the general purpose pins: PTA10, PTD0, and PTE4 must be set to low drive.
8. Measured at input $V = V_{SS}$
9. Measured at input $V = V_{DD}$

	High-gain mode (HGO=1)	1.15	—	—	V	

1. Crystal oscillator circuit provides stable oscillations when $g_{mXOSC} > 5 * g_{m_crit}$. The g_{m_crit} is defined as:

$$g_{m_crit} = 4 * (ESR + R_S) * (2\pi F)^2 * (C_0 + C_L)^2$$

where:

- g_{mXOSC} is the transconductance of the internal oscillator circuit
- ESR is the equivalent series resistance of the external crystal
- R_S is the series resistance connected between XTAL pin and external crystal for current limitation
- F is the external crystal oscillation frequency
- C_0 is the shunt capacitance of the external crystal
- C_L is the external crystal total load capacitance. $C_L = C_s + [C_1 * C_2 / (C_1 + C_2)]$
- C_s is stray or parasitic capacitance on the pin due to any PCB traces
- C_1, C_2 external load capacitances on EXTAL and XTAL pins

See manufacture datasheet for external crystal component values

- When low-gain is selected, internal R_F will be selected and external R_F should not be attached.
 - When high-gain is selected, external R_F (1 M Ohm) needs to be connected for proper operation of the crystal. For external resistor, up to 5% tolerance is allowed.
- R_S should be selected carefully to have appropriate oscillation amplitude for both protecting crystal or resonator device and satisfying proper oscillation startup condition.
- The EXTAL and XTAL pins should only be connected to required oscillator components and must not be connected to any other devices.

6.2.2 External System Oscillator frequency specifications

Table 18. External System Oscillator frequency specifications

Symbol	Description	Min.		Typ.		Max.		Unit	Notes
		S32K14x	S32K11x	S32K14x	S32K11x	S32K14x	S32K11x		
f _{osc_hi}	Oscillator crystal or resonator frequency	4		—		40 ¹		MHz	
f _{ec_extal}	Input clock frequency (external clock mode)	—		—		50	48	MHz	2
t _{dc_extal}	Input clock duty cycle (external clock mode)	48		50		52		%	2
t _{cst}	Crystal Start-up Time								
	8 MHz low-gain mode (HGO=0)	—		1.5		—		ms	3
	8 MHz high-gain mode (HGO=1)	—		2.5		—			
	40 MHz low-gain mode (HGO=0)	—		2		—			
	40 MHz high-gain mode (HGO=1)	—		2		—			

1. For an ideal clock of 40 MHz, if permitted by application requirements, an error of +/- 5% is supported with 50% duty cycle
2. Frequencies below 40 MHz can be used for degraded duty cycle upto 40-60%
3. Proper PC board layout procedures must be followed to achieve specifications.

6.2.3 System Clock Generation (SCG) specifications

6.2.3.1 Fast internal RC Oscillator (FIRC) electrical specifications

Table 19. Fast internal RC Oscillator electrical specifications

Symbol	Parameter ¹	Value			Unit
		Min.	Typ.	Max.	
F_{FIRC}	FIRC target frequency	—	48	—	MHz
ΔF	Frequency deviation across process, voltage, and temperature < 105°C	—	±0.5	±1	% F_{FIRC}
ΔF_{125}	Frequency deviation across process, voltage, and temperature < 125°C	—	±0.5	±1.1	% F_{FIRC}
$T_{Startup}$	Startup time		3.4	5	μs ²
T_{JIT} ³	Cycle-to-Cycle jitter	—	300	500	ps
T_{JIT} ³	Long term jitter over 1000 cycles	—	0.04	0.1	% F_{FIRC}

1. With FIRC regulator enable

2. Startup time is defined as the time between clock enablement and clock availability for system use.

3. FIRC as system clock

NOTE

Fast internal RC oscillator is compliant with LIN when device is used as a slave node.

6.2.3.2 Slow internal RC oscillator (SIRC) electrical specifications

Table 20. Slow internal RC oscillator (SIRC) electrical specifications

Symbol	Parameter	Value			Unit
		Min.	Typ.	Max.	
F_{SIRC}	SIRC target frequency	—	8	—	MHz
ΔF	Frequency deviation across process, voltage, and temperature < 105°C	—	—	±3	% F_{SIRC}
ΔF_{125}	Frequency deviation across process, voltage, and temperature < 125°C	—	—	±3.3	% F_{SIRC}
$T_{Startup}$	Startup time	—	9	12.5	μs ¹

1. Startup time is defined as the time between clock enablement and clock availability for system use.

6.2.4 Low Power Oscillator (LPO) electrical specifications

Table 21. Low Power Oscillator (LPO) electrical specifications

Symbol	Parameter	Min.	Typ.	Max.	Unit
F _{LPO}	Internal low power oscillator frequency	113	128	139	kHz
T _{startup}	Startup Time	—	—	20	μs

6.2.5 SPLL electrical specifications

Table 22. SPLL electrical specifications

Symbol	Parameter	Min.	Typ.	Max.	Unit
F _{SPLL_REF} ¹	PLL Reference Frequency Range	8	—	16	MHz
F _{SPLL_Input} ²	PLL Input Frequency	8	—	40	MHz
F _{VCO_CLK}	VCO output frequency	180	—	320	MHz
F _{SPLL_CLK}	PLL output frequency	90	—	160	MHz
J _{CYC_SPLL}	PLL Period Jitter (RMS) ³				
	at F _{VCO_CLK} 180 MHz	—	120	—	ps
	at F _{VCO_CLK} 320 MHz	—	75	—	ps
J _{ACC_SPLL}	PLL accumulated jitter over 1μs (RMS) ³				
	at F _{VCO_CLK} 180 MHz	—	1350	—	ps
	at F _{VCO_CLK} 320 MHz	—	600	—	ps
D _{UNL}	Lock exit frequency tolerance	± 4.47	—	± 5.97	%
T _{SPLL_LOCK}	Lock detector detection time ⁴	—	—	150 × 10 ⁻⁶ + 1075(1/F _{SPLL_REF})	s

1. F_{SPLL_REF} is PLL reference frequency range after the PREDIV. For PREDIV and MULT settings refer SCG_SPLLCFG register of Reference Manual.
2. F_{SPLL_Input} is PLL input frequency range before the PREDIV must be limited to the range 8 MHz to 40 MHz. This input source could be derived from a crystal oscillator or some other external square wave clock source using OSC bypass mode. For external clock source settings refer SCG_SOSCCFG register of Reference Manual.
3. This specification was obtained using a NXP developed PCB. PLL jitter is dependent on the noise characteristics of each PCB and results will vary
4. Lock detector detection time is defined as the time between PLL enablement and clock availability for system use.

1. All command times assumes 25 MHz or greater flash clock frequency (for synchronization time between internal/external clocks).
2. Maximum times for erase parameters based on expectations at cycling end-of-life.
3. For all EEPROM Emulation terms, the specified timing shown assumes previous record cleanup has occurred. This may be verified by executing FCCOB Command 0x77, and checking FCCOB number 5 contents show 0x00 - No EEPROM issues detected.
4. 1st time EERAM writes after a Reset or SETRAM may incur additional overhead for EEE cleanup, resulting in up to 2x the times shown.
5. Only after the Nth write completes will any data be valid. Emulated EEPROM record scheme cleanup overhead may occur after this point even after a brownout or reset. If power on reset occurs before the Nth write completes, the last valid record set will still be valid and the new records will be discarded.
6. Quick Write times may take up to 550 μ s, as additional cleanup may occur when crossing sector boundaries.
7. Time for emulated EEPROM record scheme overhead cleanup. Automatically done after last (Nth) write completes, assuming still powered. Or via SETRAM cleanup execution command is requested at a later point.

1. All command times assume 25 MHz or greater flash clock frequency (for synchronization time between internal/external clocks).
2. Maximum times for erase parameters based on expectations at cycling end-of-life.
3. For all EEPROM Emulation terms, the specified timing shown assumes previous record cleanup has occurred. This may be verified by executing FCCOB Command 0x77, and checking FCCOB number 5 contents show 0x00 - No EEPROM issues detected.
4. 1st time EERAM writes after a Reset or SETRAM may incur additional overhead for EEE cleanup, resulting in up to 2x the times shown.
5. Only after the Nth write completes will any data be valid. Emulated EEPROM record scheme cleanup overhead may occur after this point even after a brownout or reset. If power on reset occurs before the Nth write completes, the last valid record set will still be valid and the new records will be discarded.
6. Quick Write times may take up to 550 μs, as additional cleanup may occur when crossing sector boundaries.
7. Time for emulated EEPROM record scheme overhead cleanup. Automatically done after last (Nth) write completes, assuming still powered. Or via SETRAM cleanup execution command is requested at a later point.

NOTE

Under certain circumstances FlexMEM maximum times may be exceeded. In this case the user or application may wait, or assert reset to the FTFC macro to stop the operation.

1. Data retention period per block begins upon initial user factory programming or after each subsequent erase.
2. Program and Erase for PFlash and DFlash are supported across product temperature specification in Normal Mode (not supported in HSRUN mode).
3. Cycling endurance is per DFlash or PFlash Sector.
4. Data retention period per block begins upon initial user factory programming or after each subsequent erase. Background maintenance operations during normal FlexRAM usage extend effective data retention life beyond 5 years.
5. FlexMemory write endurance specified for 16-bit and/or 32-bit writes to FlexRAM and is supported across product temperature specification in Normal Mode (not supported in HSRUN mode). Greater write endurance may be achieved with larger ratios of EEPROM backup to FlexRAM.
6. For usage of any EEE driver other than the FlexMemory feature, the endurance spec will fall back to the specified endurance value of the D-Flash specification (1K).
7. [FlexMemory calculator tool](#) is available at NXP web site for help in estimation of the maximum write endurance achievable at specific EEPROM/FlexRAM ratios. The “In Spec” portions of the online calculator refer to the NVM reliability specifications section of data sheet. This calculator is only applies to the FlexMemory feature.

6.3.2 QuadSPI AC specifications

The following table describes the QuadSPI electrical characteristics.

- Measurements are with maximum output load of 25 pF, input transition of 1 ns and pad configured with fastest slew settings (DSE = 1'b1).
- I/O operating voltage ranges from 2.97 V to 3.6 V
- While doing the mode transition (RUN -> HSRUN or HSRUN -> RUN), the interface should be OFF.
- Add 50 ohm series termination on board in QuadSPI SCK for Flash A to avoid loop back reflection when using in Internal DQS (PAD Loopback) mode.
- QuadSPI trace length should be 3 inches.
- For non-Quad mode of operation if external device doesn't have pull-up feature, external pull-up needs to be added at board level for non-used pads.
- With external pull-up, performance of the interface may degrade based on load associated with external pull-up.

f_{CONV}	ADC conversion frequency	No ADC hardware averaging. ⁵ Continuous conversions enabled, subsequent conversion time	46.4	928	1160	Ksps	6, 7
		ADC hardware averaging set to 32. ⁵ Continuous conversions enabled, subsequent conversion time	1.45	29	36.25	Ksps	6, 7

1. Typical values assume $V_{DDA} = 5\text{ V}$, $\text{Temp} = 25\text{ }^{\circ}\text{C}$, $f_{ADCK} = 40\text{ MHz}$, $R_{AS}=20\text{ }\Omega$, and $C_{AS}=10\text{ nF}$ unless otherwise stated. Typical values are for reference only, and are not tested in production.
2. For packages without dedicated V_{REFH} and V_{REFL} pins, V_{REFH} is internally tied to V_{DDA} , and V_{REFL} is internally tied to V_{SS} . To get maximum performance, reference supply quality should be better than SAR ADC. See application note [AN5032](#) for details.
3. Clock and compare cycle need to be set according to the guidelines mentioned in the *Reference Manual*.
4. ADC conversion will become less reliable above maximum frequency.
5. When using ADC hardware averaging, see the *Reference Manual* to determine the most appropriate setting for AVGS.
6. Numbers based on the minimum sampling time of 275 ns.
7. For guidelines and examples of conversion rate calculation, see the *Reference Manual* section 'Calibration function'

6.4.1.2 12-bit ADC electrical characteristics

NOTE

- ADC performance specifications are documented using a single ADC. For parallel/simultaneous operation of both ADCs, either for sampling the same channel by both ADCs or for sampling different channels by each ADC, some amount of decrease in performance can be expected. Care must be taken to stagger the two ADC conversions, in particular the sample phase, to minimize the impact of simultaneous conversions.
- On reduced pin packages where ADC reference pins are shared with supply pins, ADC analog performance characteristics may be impacted. The amount of variation will be directly impacted by the external PCB layout and hence care must be taken with PCB routing. See [AN5426](#) for details

Table 28. 12-bit ADC characteristics (2.7 V to 3 V) ($V_{REFH} = V_{DDA}$, $V_{REFL} = V_{SS}$)

1. All accuracy numbers assume the ADC is calibrated with $V_{REFH}=V_{DDA}=V_{DD}$, with the calibration frequency set to less than or equal to half of the maximum specified ADC clock frequency.
2. Typical values assume $V_{DDA} = 3\text{ V}$, Temp = 25 °C, $f_{ADCK} = 40\text{ MHz}$, $R_{AS}=20\ \Omega$, and $C_{AS}=10\text{ nF}$.
3. The ADC supply current depends on the ADC conversion rate.
4. Represents total static error, which includes offset and full scale error.
5. $1\text{ LSB} = (V_{REFH} - V_{REFL})/2^N$
6. The specifications are with averaging and in standalone mode only. Performance may degrade depending upon device use case scenario. When using ADC averaging, refer to the *Reference Manual* to determine the most appropriate settings for AVGS.
7. For ADC signals adjacent to V_{DD}/V_{SS} or XTAL/EXTAL or high frequency switching pins, some degradation in the ADC performance may be observed.
8. All values guarantee the performance of the ADC for multiple ADC input channel pins. When using ADC to monitor the internal analog parameters, assume minor degradation.
9. All the parameters in the table are given assuming system clock as the clocking source for ADC.

9. All the parameters in the table are given assuming system clock as the clocking source for ADC.

NOTE

- Due to triple bonding in lower pin packages like 32-QFN, 48-LQFP, and 64-LQFP degradation might be seen in ADC parameters.
- When using high speed interfaces such as the QuadSPI, SAI0, SAI1 or ENET there may be some ADC degradation on the adjacent analog input paths. See following table for details.

NOTE

For comparator IN signals adjacent to V_{DD}/V_{SS} or XTAL/EXTAL or switching pins cross coupling may happen and hence hysteresis settings can be used to obtain the desired comparator performance. Additionally, an external capacitor (1nF) should be used to filter noise on input signal. Also, source drive should not be weak (Signal with < 50 K pull up/down is recommended).

6.5.1 LPUART electrical specifications

Refer to [General AC specifications](#) for LPUART specifications.

6.5.1.1 Supported baud rate

Baud rate = Baud clock / ((OSR+1) * SBR).

For details, see section: 'Baud rate generation' of the *Reference Manual*.

6.5.2 LPSPI electrical specifications

The Low Power Serial Peripheral Interface (LPSPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic LPSPI timing modes.

- All timing is shown with respect to 20% V_{DD} and 80% V_{DD} thresholds.
- All measurements are with maximum output load of 50 pF, input transition of 1 ns and pad configured with fastest slew setting (DSE = 1).

- Trace length should not exceed 11 inches for SCK pad when used in Master loopback mode.
- While transitioning from HSRUN mode to RUN mode, LPSPI output clock should not be more than 14 MHz.
- f_{periph} = LPSPI peripheral clock
- $t_{\text{periph}} = 1/f_{\text{periph}}$
- Master Loopback mode - In this mode LPSPI_SCK clock is delayed for sampling the input data which is enabled by setting LPSPI_CFGR1[SAMPLE] bit as 1. Clock pads used are PTD15 and PTE0. Applicable only for LPSPI0.
- Master Loopback (slow) - In this mode LPSPI_SCK clock is delayed for sampling the input data which is enabled by setting LPSPI_CFGR1[SAMPLE] bit as 1. Clock pad used is PTB2. Applicable only for LPSPI0.
- This is the maximum operating frequency (f_{op}) for LPSPI0 with medium PAD type only. Otherwise, the maximum operating frequency (f_{op}) is 12 Mhz.
- Set the PCSSCK configuration bit as 0, for a minimum of 1 delay cycle of LPSPI baud rate clock, where PCSSCK ranges from 0 to 255.
- Set the SCKPCS configuration bit as 0, for a minimum of 1 delay cycle of LPSPI baud rate clock, where SCKPCS ranges from 0 to 255.
- While selecting odd dividers, ensure Duty Cycle is meeting this parameter.
- Maximum operating frequency (f_{op}) is 12 MHz irrespective of PAD type and LPSPI instance.
- Applicable for LPSPI0 only with medium PAD type, with maximum operating frequency (f_{op}) as 14 MHz.

6.5.5 SAI electrical specifications

The following table describes the SAI electrical characteristics.

- Measurements are with maximum output load of 50 pF, input transition of 1 ns and pad configured with fastest slew settings (DSE = 1'b1).
- I/O operating voltage ranges from 2.97 V to 3.6 V
- While doing the mode transition (RUN -> HSRUN or HSRUN -> RUN), the interface should be OFF.

7 Thermal attributes

7.1 Description

The tables in the following sections describe the thermal characteristics of the device.

NOTE

Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting side (board) temperature, ambient temperature, air flow, power dissipation or other components on the board, and board thermal resistance.

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per JEDEC JESD51-2 with natural convection for horizontally oriented board. Board meets JESD51-9 specification for 1s or 2s2p board, respectively.
3. Per JEDEC JESD51-6 with forced convection for horizontally oriented board. Board meets JESD51-9 specification for 1s or 2s2p board, respectively.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal resistance between the die and the solder pad on the bottom of the package. Interface resistance is ignored.
7. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.
7. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

7.3 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature, T_J , can be obtained from this equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

- T_A = ambient temperature for the package (°C)
- $R_{\theta JA}$ = junction to ambient thermal resistance (°C/W)
- P_D = power dissipation in the package (W)

The junction to ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. Unfortunately, there are two values in common usage: the value determined on a single layer board and the value obtained on a board with two planes. For packages such as the PBGA, these values can be different by a factor of two. Which value is closer to the application depends on the power dissipated by other components on the board. The value obtained on a single layer board is appropriate for the tightly packed printed circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated.

When a heat sink is used, the thermal resistance is expressed in the following equation as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

- $R_{\theta JA}$ = junction to ambient thermal resistance (°C/W)
- $R_{\theta JC}$ = junction to case thermal resistance (°C/W)
- $R_{\theta CA}$ = case to ambient thermal resistance (°C/W)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user controls the thermal environment to change the case to ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the size of the heat sink, the air flow around the device, the interface material, the mounting arrangement on printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device.

To determine the junction temperature of the device in the application when heat sinks are not used, the Thermal Characterization Parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using this equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

- T_T = thermocouple temperature on top of the package (°C)
- Ψ_{JT} = thermal characterization parameter (°C/W)
- P_D = power dissipation in the package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.
